

## New Audatex Graphic Files

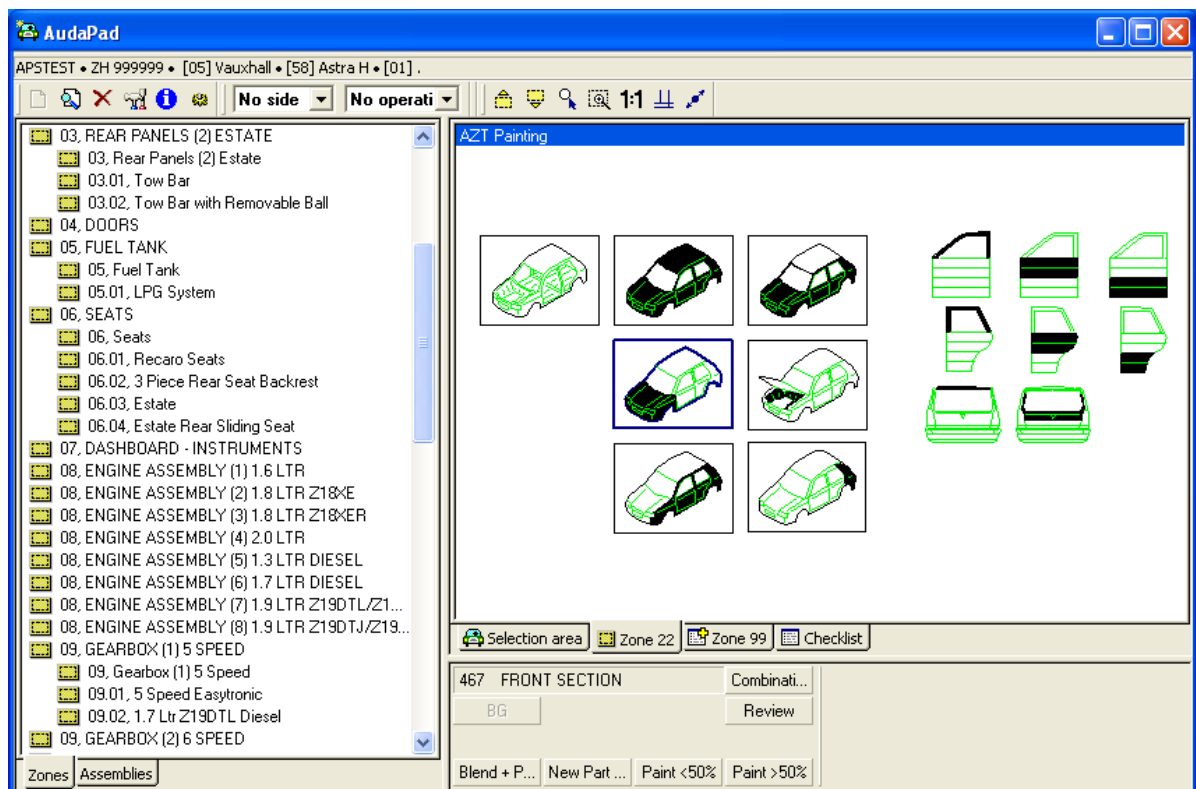

Dear Audatex customer,

As part of our ongoing enhancement program we have developed a new generation of graphic files. The first of these files are included on this release and will continue to work in the same way as the previous files.

The enhancements are:

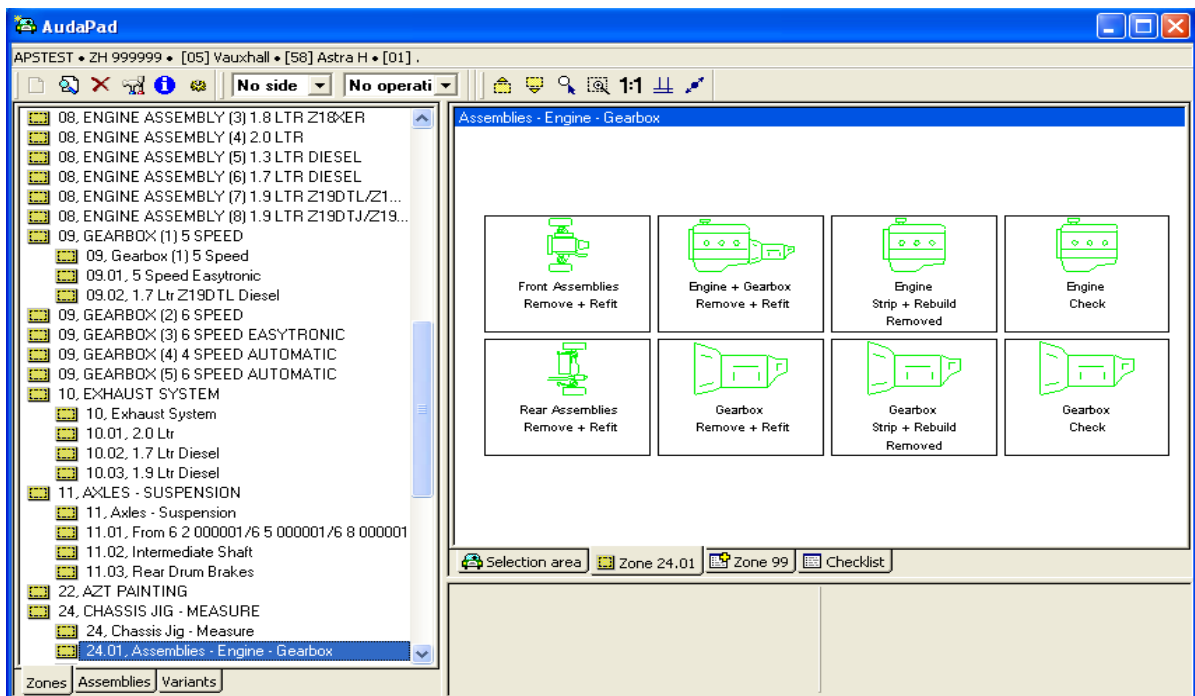

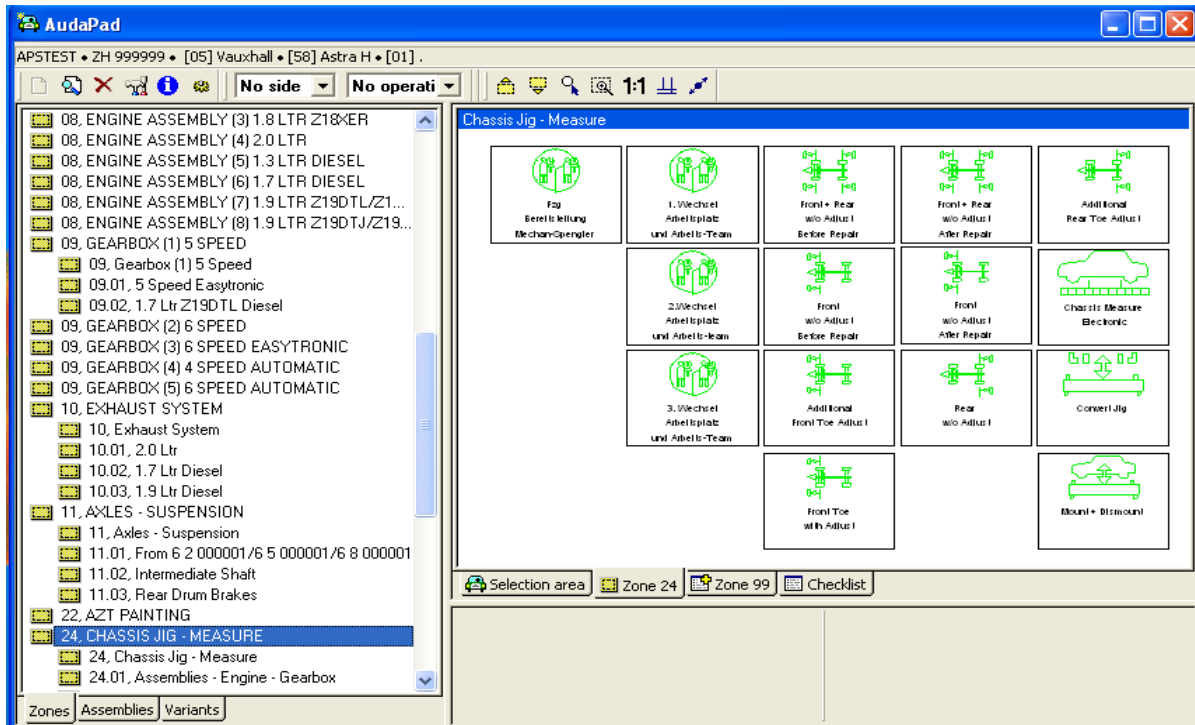

### Paint – AZT:

The partial painting boxes have been replaced by graphical symbols as shown below.

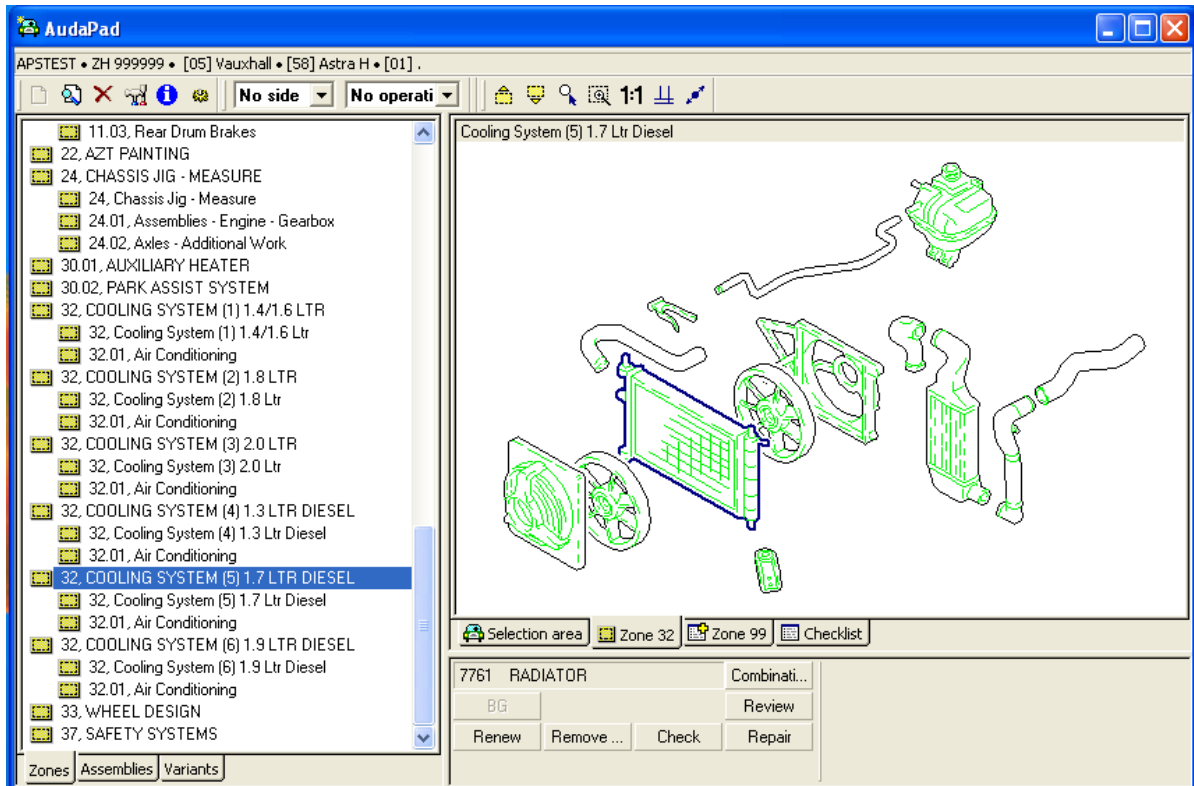

## Associated work:

Previous layout of text boxes have now been replaced by graphic symbols with text. To ensure the readability on small screens these symbols have been subdivided in 2-3 zones.

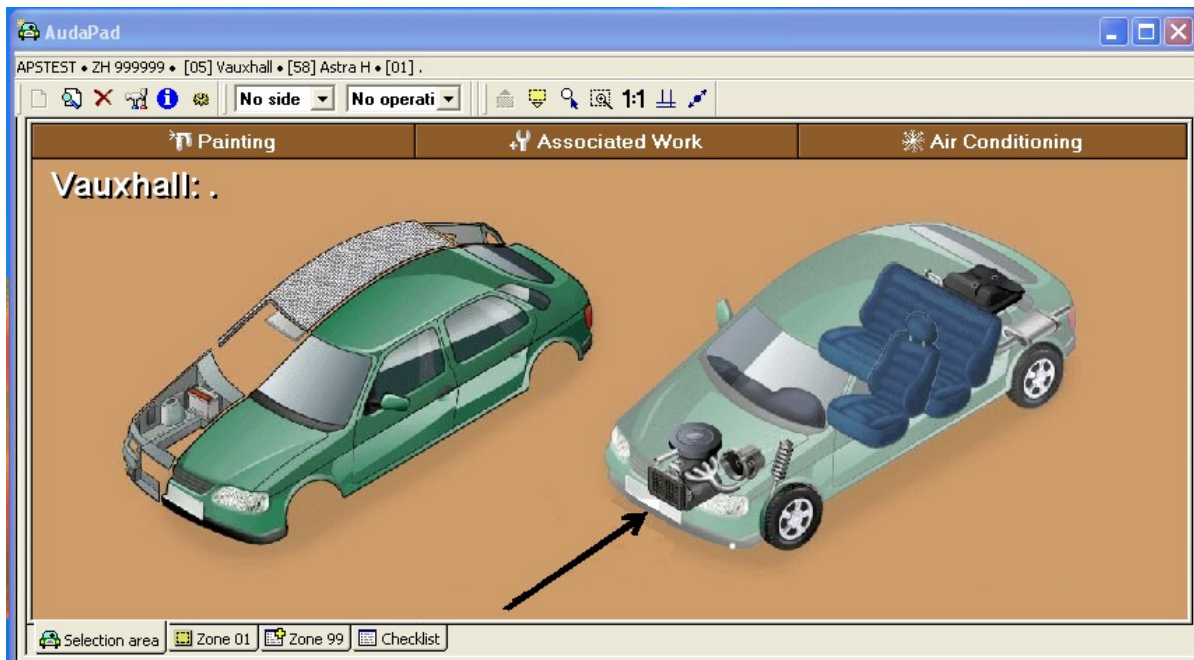

## Cooling system:

A separate cooling zone has been introduced to cope with the increasing complexity of the cooling and air conditioning system.

To reach the cooling zone directly from the navigation zone- Just click the Radiator.

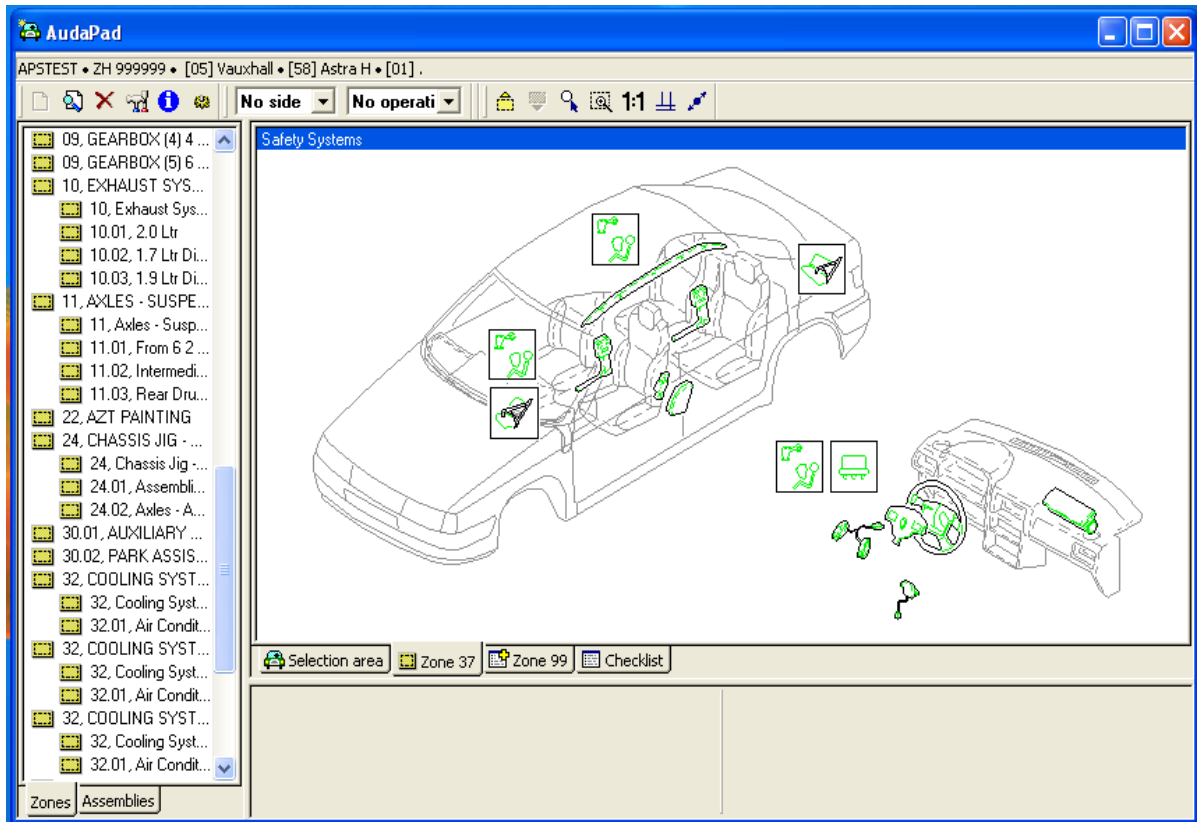

**Engine Zones:**

Each engine zone will now be shown as a complete zone containing all components associated with each particular engine

**Airbag / Safety zone:**

All safety relevant parts like airbags or safety belts have now been concentrated into a new single zone. As before, you can also find these parts in the usual zones.

**Assembly Items:**

With these new files the assembly lines have been removed from the graphics however it is still possible to review assembly items in a highlighted manner using the assembly button
